

ESTOQI Case Study: Nutrition Enrichment

Red Capsicum

A laboratory analysis evaluating the effect of two washing methods on Vitamin-A and Beta-Carotene content across matched red capsicum samples.

Vitamin-A & Beta-Carotene

Normal water  95.8 µg/100g

Estoqi Wash  280.7 µg/100g

At these levels, normal water washing left Beta-Carotene retention significantly lower than the standard quantification threshold, while Estoqi Wash preserved measurable levels nearly 3× above it.

193%

higher Vitamin A & Beta-Carotene retention with Estoqi Wash.

LOQ

Normal water sample fell below limit of quantification (100 µg/100g)

Estoqi Wash

Indicating Better:

Beta-Carotene Preservation

Vitamin-A retention

Antioxidant stability

Lab Tested by: Envirocare Labs
Testing Method: AOAC 974.29, 22nd Edition: 2023
Report Date: 13 October 2025
