Scroll 1	Hero	<i>Eyebrow</i>	THE ESTOQI SYSTEM	Keep		
Scroll 1	Hero	<i>Headline</i>	Precision Water Intelligence	Replace with: 'The Machine That Makes Two Waters.'		Plain language. Specific to what the System actually does.
Scroll 1	Hero	<i>Body Copy</i>	Designed not only as a system of function, but as a system of intent. Two streams. One electrolysis chamber. Every output measured, verified, and purposeful.	Replace with: 'One countertop unit. One electrolysis chamber. Two dedicated outlets — one for pH 11.5 wash water, one for pH 9.5 hydrogen-rich drinking water. Both produced simultaneously, on demand.'	Product photography — the actual machine, clean and premium	Functional, specific, no jargon.
Scroll 2	The Ionization Flow	<i>Eyebrow</i>	HOW IT WORKS	Keep		
Scroll 2	The Ionization Flow	<i>Headline</i>	The Ionization Flow	Keep	Demo snippet: 'How Estogi Water Is Made'	
Scroll 2	Step 01	<i>Title</i>	Source Water	Keep		
Scroll 2	Step 01	<i>Body</i>	Municipal or filtered water enters the ESTOQI system through a precision pre-filter that removes sediment and chlorine.	Keep — accurate and clear		
Scroll 2	Step 02	<i>Title</i>	Electrolysis Chamber	Keep		
Scroll 2	Step 02	<i>Body</i>	Water passes through platinum-coated titanium electrode plates where electrolysis separates water into two distinct ionic streams.	Replace with: 'Water passes through surgical-coated titanium electrode plates. An electrical current splits the water into two distinct ionic streams — one alkaline, one acidic.'		Your point #8 — surgical-coated, not platinum-coated. Confirm specification.
Scroll 2	Step 03	<i>Title</i>	11.5 pH Stream	Keep		
Scroll 2	Step 03	<i>Body</i>	The alkaline stream reaches 11.5 pH — powerful enough to emulsify oil-based pesticides and surface contaminants from produce.	Keep		
Scroll 2	Step 04	<i>Title</i>	9.5 pH Stream	Keep		
Scroll 2	Step 04	<i>Body</i>	The drinking stream is calibrated to 9.5 pH with negative ORP, delivering antioxidant-rich, micro-clustered hydration.	Replace with: 'The drinking stream is calibrated to 9.5 pH. Hydrogen-rich (1,200 ppb H ₂), micro-clustered, and antioxidant — with negative ORP that fights free radicals at the cellular level.'		Your point #9 — hydrogen-rich is a key missing claim here.
Scroll 2	Step 05	<i>Title</i>	Dual Application	Keep		
Scroll 2	Step 05	<i>Body</i>	Two dedicated outlets deliver each stream precisely where needed — produce wash basin and drinking tap — simultaneously.	Keep		
Scroll 3	Explore the Spectrum	<i>Eyebrow</i>	DUAL PH INTELLIGENCE	Replace with: 'WHERE EVERYTHING YOU CONSUME SITS'		Your point #10 — make it hard-hitting and awareness-led, not chemistry-tour.
Scroll 3	Explore the Spectrum	<i>Headline</i>	Explore the Spectrum	Replace with: 'Most of what you drink is more acidic than you think.'		Hard-hitting consumer awareness, per your brief.
Scroll 3	Explore the Spectrum	<i>Subhead</i>	Drag the slider to explore the full pH spectrum — from strongly acidic to strongly alkaline.	Replace with: 'Drag the slider. See where cola, coffee, tap water, and pesticides actually sit. Then see where Estogi sits — and why that matters.'		Specific, conversational, creates the discovery moment.
Scroll 3	Slider Stop — pH 3.5	<i>Label</i>	ACIDIC	STRONGLY ACIDIC		
Scroll 3	Slider Stop — pH 3.5	<i>Body</i>	[current copy from screenshot]	Cola. Vinegar. Lemon juice. The same acidity that wears down tooth enamel — and the same range many of us drink several times a week.'		Awareness, not chemistry.
Scroll 3	Slider Stop — pH 5	<i>Body</i>	—	Coffee. Black tea. Beer. Mildly acidic — pleasant in moderation, but a diet built around acidic drinks adds up.'		
Scroll 3	Slider Stop — pH 7	<i>Body</i>	—	Tap water. Rainwater. Pure water. Neutral. And — uncomfortably — the exact pH most agricultural pesticides are engineered to survive.'		Punchy reveal. The 'uncomfortably' word does the emotional work.
Scroll 3	Slider Stop — pH 8	<i>Body</i>	—	Sea water. Baking soda solution. Mildly alkaline. Beyond hydration, but not yet doing anything meaningful for your food or your cells.'		
Scroll 3	Slider Stop — pH 9.5	<i>Body</i>	—	ESTOQI Drinking Water. Hydrogen-rich. Micro-clustered. Negative ORP. The pH at which water starts working for your body, not just hydrating it.'		
Scroll 3	Slider Stop — pH 11.5	<i>Body</i>	—	ESTOQI Produce Wash. The pH at which oil-based pesticides dismantle — the same chemistry as dish soap, without any soap.'		
Scroll 3	Slider Stop — pH 12.5	<i>Body</i>	—	Bleach. Industrial degreasers. Past this point, alkalinity becomes corrosive. Estogi stops where the science demands — not where the marketing wants it.'		Differentiates Estogi from 'higher pH is better' wellness scams.
Scroll 4	Water at the Molecular Level	<i>Eyebrow</i>	MOLECULAR SCIENCE	Keep		
Scroll 4	Water at the Molecular Level	<i>Headline</i>	Water at the Molecular Level	Keep		
Scroll 4	Water at the Molecular Level	<i>Body 1</i>	ESTOQI's electrolysis process restructures water molecules into smaller micro-clusters, enhancing cellular absorption and bioavailability by up to 6x compared to conventional water.			Flag — '6x bioavailability' needs a source or it'll attract criticism.
Scroll 4	Water at the Molecular Level	<i>Body 2</i>	The negative ORP (Oxidation-Reduction Potential) of 9.5 pH water acts as a powerful antioxidant, neutralizing free radicals at the cellular level.	Keep — but lock the ORP number across the site first		
Scroll 5	The Science of Ionization	<i>All</i>	[As on current site]	Keep — content is accurate		
Scroll 6	Oxidation-Reduction Potential	<i>All</i>	[As on current site]	Keep — but reconcile ORP number first		Critical data inconsistency to resolve.
Scroll 7	Enhanced Cellular Absorption	<i>All</i>	[As on current site]	Keep
